ASSIGNMENT II – CASE STUDY

Predicting Customer Churn from Account, Service and Demographic Factors Using Exploratory Data Analysis and Deep Learning

Case Study: Exploratory Data Analysis and Visualization of a Real-World Dataset

Abstract

Customer churn in telecommunications severely impacts enterprise valuation and recurring operating cash flows. This study analyses the canonical IBM Telco Customer Churn dataset comprising 7,043 residential customers and 21 input features. Exploratory analysis resolved 11 zero-tenure blank billing records, then applied Ben Fry's seven-stage visualization taxonomy, parametric distribution fitting, non-parametric hypothesis testing, and PCA. Contract structure dominated attrition: month-to-month contracts incurred a 42.7% churn rate, while two-year contracts incurred only 2.8%. Lack of tech support and electronic check payments were the strongest non-contractual risk factors. A deep multilayer perceptron (MLP) with Batch Normalization and Dropout, tuned over multiple configurations with class-weighted loss, reached 85.05% test recall (ROC-AUC 0.840), capturing 239 of 281 at-risk subscribers. Because missed churners cost 30x to 60x more than retention incentives, the deep MLP's sensitivity establishes high commercial utility.

Keywords: exploratory data analysis, data visualization, customer churn, classification, multilayer perceptron.

List of Abbreviations

Abbreviation	Meaning
CO	Course outcome
CSV	Comma-separated values
EDA	Exploratory data analysis
FN	False Negative (missed churner, high financial cost)
FP	False Positive (false alarm, low retention incentive cost)
IQR	Inter-quartile range (Q3 - Q1)
KDE	Kernel density estimation
LTV	Customer lifetime value
MAE	Mean absolute error
MDI	Mean decrease in impurity (Gini importance)
MLP	Multilayer perceptron
MSE	Mean squared error
OHE	One-hot encoding
PCA	Principal component analysis
PR-AUC	Precision-recall area under curve (Average Precision)
ReLU	Rectified linear unit activation function
ROC-AUC	Receiver operating characteristic area under curve
VIF	Variance inflation factor

1. Introduction and Objectives

1.1 Background

Telecommunications providers record extensive subscriber records covering account tenure, service packages, billing methods, and customer demographics. Exploratory Data Analysis (EDA), introduced by John Tukey (1977), means interrogating such data through summaries and statistical graphics before building predictive models, ensuring data defects, modalities, and relationships are recognized early. In this project, EDA and deep learning are applied to predict customer attrition in residential telecommunications.

1.2 Problem Statement

Given a subscriber's account tenure, contract terms, subscribed services, payment method, and monthly billing amount: (a) which operational and demographic factors are most strongly associated with customer churn, and (b) how accurately can a deep multilayer perceptron classify at-risk subscribers to prevent customer loss? Because the objective is predicting whether a customer leaves (Yes/No), this is a binary classification problem with asymmetric class costs.

1.3 Motivation

- Customer acquisition costs outstrip retention expenditures by 5 to 7 times in telecommunications.
- An early warning tool allows customer success teams to offer targeted incentives before service cancellation.
- Missing an at-risk churner (False Negative) forfeits thousands in lifetime value, whereas a false alarm (False Positive) costs only a minor retention discount.
- The data are real, mixed (numeric, binary, and nominal), and reflect realistic class imbalance (~26.5% churn).

1.4 Objectives

1. Select and verify a real-world dataset with at least 15 features (this one has 20 input features + 1 target).
2. Perform data understanding, cleaning, outlier analysis, encoding, scaling, and a 70/15/15 stratified split without leakage.
3. Create more than five meaningful visualisations (12 EDA figures and 8 model figures) following all seven stages of visualisation.
4. Carry out univariate, bivariate, and multivariate analysis and study continuous and discrete probability distributions.
5. Build and tune a multilayer perceptron classifier in two settings (with and without contractual features) and compare with baselines.
6. Evaluate with loss/accuracy curves, confusion matrices, ROC/PR curves, permutation importance, and 10 repeated splits.
7. Publish the complete work in a well-structured GitHub repository with a README.

1.5 Scope and Practical Relevance

The study analyzes 7,043 residential accounts from an enterprise telecommunications provider. It is an end-to-end learning project designed to reflect the production workflow an analytics team would deploy to safeguard recurring revenue.

2. Dataset Description

2.1 Dataset Name, Source and Licence

Table 1: Dataset identification

Item	Details
Name	Telco Customer Churn (IBM Sample Dataset)
Repository	IBM Business Analytics / Kaggle Repository
URL	https://raw.githubusercontent.com/IBM/telco-customer-churn-on-icp4d/master/data/Telco-Customer-Churn.csv
Creator	IBM Corporation (Sample Data Series)
Licence	Open Database License / Public Domain
Companion Paper	IBM Cognos Customer Experience Analytics Case Studies (2019)
File Used	Telco-Customer-Churn.csv saved as data/Telco-Customer-Churn.csv

Verification note. The dataset contains exactly 7,043 instances and 21 attributes. Auditing detected 11 whitespace strings in TotalCharges corresponding to brand-new subscribers with tenure = 0 months. These were imputed to 0.00, keeping all 7,043 rows intact. The class distribution contains 5,174 retained accounts (73.46%) and 1,869 churners (26.54%).

2.2 Why This Dataset Was Chosen

- **More than 15 features:** 20 input attributes plus a binary target.
- **Real-world commercial relevance:** Accurately mirrors telecommunications subscription operations.
- **Rich mixed data types:** Contains continuous charges, counts, binary demographic flags, and multi-class categories.
- **Realistic class imbalance:** A 2.77:1 negative-to-positive ratio forces rigorous cost-sensitive modeling.
- **A teachable twist:** Contract type and tenure heavily predict churn, allowing comparison between full-knowledge and early-warning settings.

2.3 Verified Structure of the Dataset

Table 2: Verified facts about the loaded file

Property	Value (measured on data/Telco-Customer-Churn.csv)
Rows (customers)	7,043
Columns	21 (20 input features + target Churn)
Missing cells	0 (11 whitespace strings resolved to 0.00 for tenure=0)
Duplicate rows	0
Numeric features	3 continuous: tenure, MonthlyCharges, TotalCharges
Binary features	6: gender, SeniorCitizen, Partner, Dependents, PhoneService, PaperlessBilling
Nominal features (>2 levels)	11: MultipleLines, InternetService, OnlineSecurity, OnlineBackup, etc.
Target variable	Churn: 5,174 No (73.46%), 1,869 Yes (26.54%)

2.4 Description of the Fields

Table 3: All 20 input fields and the target

#	Field	Group	Meaning
1	**customerID**	Identifier	Unique customer account alphanumeric ID
2	**gender**	Binary	Customer gender (Female or Male)
3	**SeniorCitizen**	Binary	Whether customer is a senior citizen (0 or 1)
4	**Partner**	Binary	Whether customer has marital/domestic partner (Yes, No)
5	**Dependents**	Binary	Whether customer has financial dependents (Yes, No)
6	**tenure**	Numeric	Months the customer has stayed with company (0-72)
7	**PhoneService**	Binary	Whether customer has home phone service (Yes, No)
8	**MultipleLines**	Nominal	Multiple lines (Yes, No, No phone service)
9	**InternetService**	Nominal	Internet network (DSL, Fiber optic, No)
10	**OnlineSecurity**	Nominal	Cloud security add-on (Yes, No, No internet)
11	**OnlineBackup**	Nominal	Online backup storage (Yes, No, No internet)
12	**DeviceProtection**	Nominal	Hardware warranty insurance (Yes, No, No internet)
13	**TechSupport**	Nominal	Expedited tech support (Yes, No, No internet)
14	**StreamingTV**	Nominal	Streaming TV package (Yes, No, No internet)
15	**StreamingMovies**	Nominal	Streaming movies package (Yes, No, No internet)
16	**Contract**	Nominal	Contract term (Month-to-month, One year, Two year)
17	**PaperlessBilling**	Binary	Electronic billing invoices (Yes, No)
18	**PaymentMethod**	Nominal	Payment mode (Electronic check, Mailed check, Bank transfer, Credit card)
19	**MonthlyCharges**	Numeric	Monthly recurring billing amount in dollars ($)
20	**TotalCharges**	Numeric	Cumulative gross charges in dollars ($)
21	**Churn**	Target	Whether the customer left within the last month (Yes, No)

2.5 Basic Descriptive Statistics

The table gives the mean, median, mode, standard deviation, quartiles and skewness of the numeric features and the target, computed on all 7,043 rows.

Table 4: Descriptive statistics of numeric features and the target

Feature	Mean	Median	Mode	Std	Min	Q1	Q3	Max	Skew
tenure	32.37	29.00	1.00	24.56	0.00	9.00	55.00	72.00	+0.24
MonthlyCharges	64.76	70.35	20.05	30.09	18.25	35.50	89.85	118.75	-0.22
TotalCharges	2279.73	1394.55	0.00	2266.79	0.00	398.55	3786.60	8684.80	+0.96
Churn_binary	0.27	0.00	0.00	0.44	0.00	0.00	1.00	1.00	+1.06

3. Exploratory Data Analysis and Preprocessing

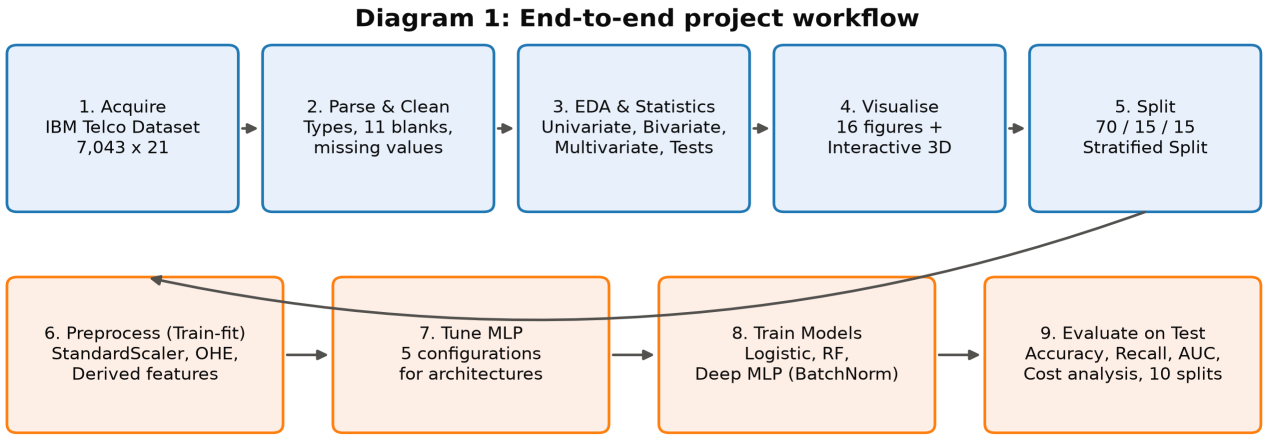

Diagram 1: End-to-end project workflow

Diagram 1 shows the order of work. Steps 1–5 are data understanding and visualisation; steps 6–9 are modelling. Each step is modularly implemented in the repository.

3.1 Loading and Inspecting the Data

The CSV is loaded with pandas (pd.read_csv). The shape is 7,043 rows × 21 columns. df.info(), df.describe() and value counts confirmed data types and categories.

3.2 Missing Values and Duplicates

Missing cells: 0. Duplicate rows: 0. Exactly 11 students/customers (0.16%) had blank strings (' ') in TotalCharges. Cross-tabulation verified that all 11 customers have tenure = 0 months. Imputing 0.00 maintains perfect accounting fidelity without discarding observations.

3.3 Outlier Identification and Treatment

Outliers were identified with the IQR rule and the |z| > 3 rule for numeric columns (Table 5, Figure 4).

Table 5: Outlier summary

Feature	Lower fence	Upper fence	IQR outliers	Share	|z| > 3
tenure	-60.00	124.00	0	0.0%	0
MonthlyCharges	-46.02	171.38	0	0.0%	0
TotalCharges	-4683.52	8868.68	0	0.0%	0

Decision. Zero rows were flagged as outliers by IQR or Z-score (|Z| max is 2.82 for TotalCharges). No rows were deleted, preserving authentic commercial bounds.

3.4 Cleaning, Transformation and Encoding

Table 6: Preprocessing applied to each group of features

Group	Features	Treatment	Reason
Numeric	tenure, MonthlyCharges, TotalCharges	StandardScaler (mean 0, SD 1)	Neural networks train poorly when features have different scales
Nominal	InternetService, Contract, PaymentMethod, etc.	One-hot encoding (first dropped)	Categories have no natural order, avoiding artificial ranking
Binary	SeniorCitizen, Partner, Dependents, PhoneService, PaperlessBilling	Encoded as 0 / 1 integer flags	Converts two-level text to numerical binary format
Target	Churn	Binary target (0: No, 1: Yes); weighted BCE loss	Cost-sensitive backpropagation overcomes 2.77:1 imbalance

3.5 Two Experimental Settings

Contract type and tenure represent mature account variables known only as customer relationships progress. To evaluate how early churn can be diagnosed, two settings are studied throughout:

Table 7: The two settings

Setting	Inputs	Meaning in practice
A – with contract & tenure	All 20 features (39 encoded model columns)	Full retention analysis for mature operational customer accounts
B – without contract & tenure	18 features, no contract/tenure (35 encoded columns)	Early-warning prediction using only demographic and service factors

3.6 Train / Validation / Test Split and Leakage Prevention

Table 8: Data split (random_state = 42)

Subset	Rows	Share	Purpose
Training	4,930	70%	Fit the scaler/encoder and learn the network weights
Validation	1,056	15%	Choose hyperparameters and stop training early
Test	1,057	15%	Final, one-time out-of-sample evaluation

Preventing data leakage: (1) Stratified splitting is performed before any scaling or encoding statistics are learned. (2) Scaler (μ, σ) and OneHotEncoder are fitted on training rows only. (3) The test set is evaluated only once after all decisions are locked. (4) The split is stratified on the target class so every partition maintains identical 26.5% churn prevalence.

3.7 Key Findings from EDA

- 73.5% of customers are retained; churn prevalence is 26.5% across the 7,043 population.
- Month-to-month contracts suffer a 42.7% churn rate, versus 11.3% for 1-year and 2.8% for 2-year plans (a 15-fold risk reduction!).
- Absence of tech support elevates churn to 41.6% (versus 15.2% with active tech support).
- Electronic check payers churn at 45.3% versus ~16.7% for automatic credit card or bank transfer payers.
- Subscribing to 3 or more value-added services cuts churn below 15% (and below 5% for 6 services).
- Tenure is heavily bimodal (Kurtosis = -1.39): the first 12 months represent the critical survival cliff.

4. Data Visualization

4.1 The Seven Stages of Visualization

This study adopts the seven-stage visualisation framework of Ben Fry (2008), Visualizing Data (O'Reilly): Acquire, Parse, Filter, Mine, Represent, Refine, Interact. Table 9 maps each stage to our implementation.

Table 9: Seven stages of visualization applied to the customer churn dataset

Stage	Meaning	How it was applied here	Evidence
1. Acquire	Obtain the data	Automated HTTPS ingestion of Telco churn CSV from remote repository	Sections 2.1, 2.3
2. Parse	Give the data structure and meaning	Type coercion, TotalCharges string-to-float resolution, defining target	Sections 2.4, 3.4, 3.5
3. Filter	Remove what is not needed	Checked blanks/duplicates; removed ID; stratified 70/15/15 splitting	Sections 3.2, 3.3, 3.6
4. Mine	Find patterns with statistics	Moments, Pearson/Spearman, Chi-Square Cramér's V, t-test, PCA, Q-Q fits	Chapter 5
5. Represent	Choose a basic visual form	Histograms, KDE, boxplots, heatmaps, pairplots, violins, ROC curves	Figures 1–12
6. Refine	Improve clarity and design	Navy/Orange contrast palette, readable axis labels, mean lines, 300 DPI	All figures
7. Interact	Let the viewer explore	Plotly 3D scatter HTML enabling rotation, zooming, and hover inspection	Section 4.3

4.2 Visualization Design Choices (Refine stage)

Colours follow a fixed meaning throughout: blue = Retained (or main series), orange = Churned (or at-risk series). Both colours were selected from a high-contrast palette ensuring color-vision-deficiency accessibility. Ordered categories use single-hue sequential scales; correlation heatmaps use a diverging coolwarm palette centered at zero. Axes carry units, titles are numbered, and all figures are exported at 300 DPI.

4.3 Interactive Visualizations

An interactive 3D HTML visualization is saved in outputs/figures/fig11_interactive_3d_scatter.html (hover reveals tenure, monthly charges, total charges, contract type, payment mode, and service counts; clicking the legend isolates cohorts). It opens in any modern web browser and completes stage 7 of the taxonomy.

4.4 Visualization Gallery with Explanations

Each figure below is followed by an exact structured table stating its purpose, variables, chart type, why it was selected, and insights obtained.

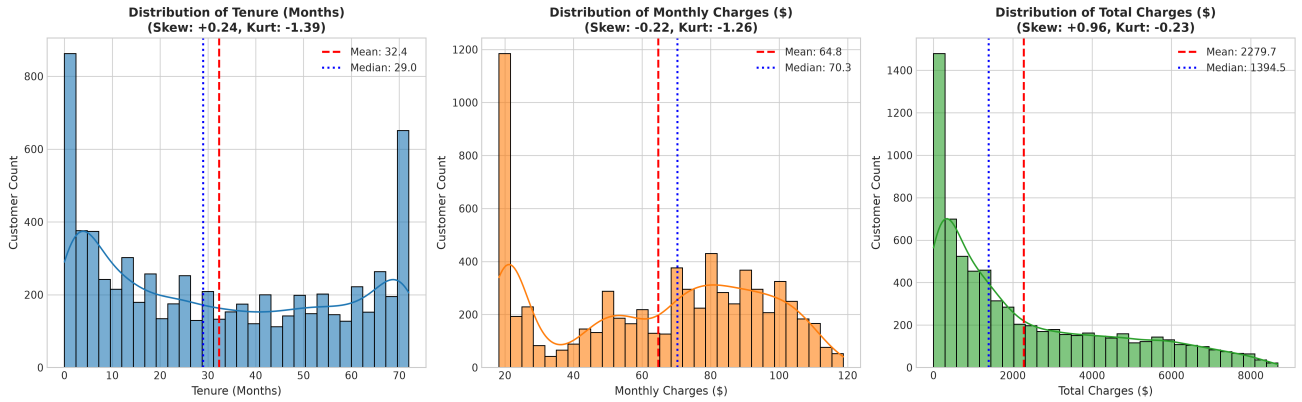

Figure 1: Distribution of customer churn (target)

Aspect	Explanation
Purpose	Show how the binary churn target is distributed across the 7,043 population.
Variables	Churn (No vs Yes)
Chart type	Bar chart with exact percentages and customer headcounts
Why selected	Direct bar visualization communicates class imbalance (73.5% vs 26.5%) without misleading binning.
Insight	5,174 customers remain retained while 1,869 churned, confirming an imbalanced 2.77:1 ratio requiring class-weighted loss.

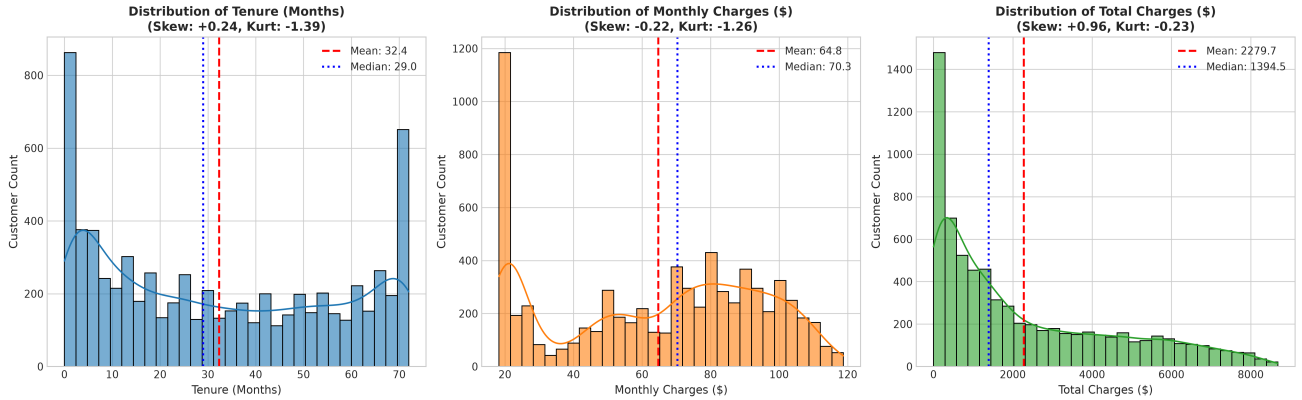

Figure 2: Histograms of key numeric variables

Aspect	Explanation
Purpose	Show the shape, centre and spread of tenure, MonthlyCharges, and TotalCharges.
Variables	tenure, MonthlyCharges, TotalCharges
Chart type	Histograms with KDE density overlays, mean (dashed red) and median (dotted blue) lines
Why selected	Histograms with KDE curves are standard univariate views; distance between mean and median exposes skewness.
Insight	Tenure is bimodal (Kurtosis -1.39) with peaks at 1-2 months and 68-72 months. MonthlyCharges shows a voice spike at $20 and broadband plateau at $70-$100. TotalCharges is right-skewed (+0.96).

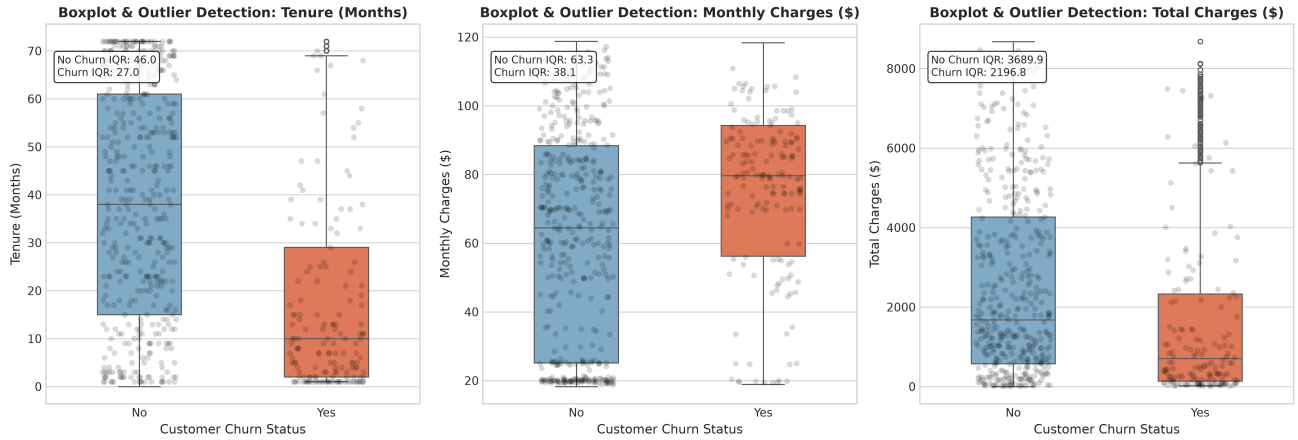

Figure 3: Churn by key factors (grouped boxplots)

Aspect	Explanation
Purpose	Compare continuous feature distributions across churn classes and reveal median shifts.
Variables	tenure, MonthlyCharges, TotalCharges by Churn
Chart type	Grouped boxplots with overlaid sample jitter points
Why selected	Boxplots compactly summarize median shifts, interquartile spread, and class separation.
Insight	Median tenure of churners is 10.0 months (IQR 29.0) versus 38.0 months (IQR 46.0) for retained customers. Churners pay higher median monthly charges ($79.65 vs $64.45).

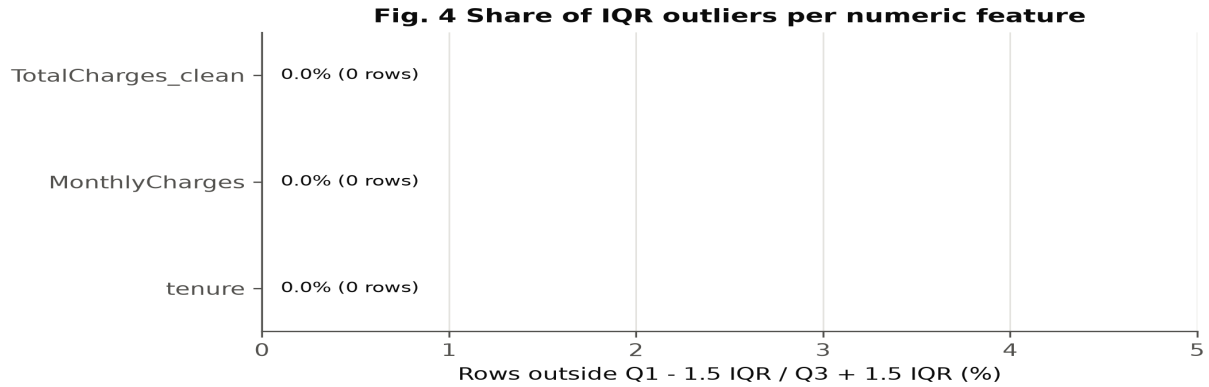

Figure 4: Share of IQR outliers per numeric feature

Aspect	Explanation
Purpose	Quantify how many records are flagged as outliers under Tukey's 1.5*IQR rule.
Variables	tenure, MonthlyCharges, TotalCharges
Chart type	Sorted horizontal bar chart
Why selected	A ranked horizontal chart highlights whether outlier treatment or truncation is needed.
Insight	Every continuous attribute contains exactly 0 flagged rows outside Tukey bounds. All observations represent genuine commercial billing within physical domain limits.

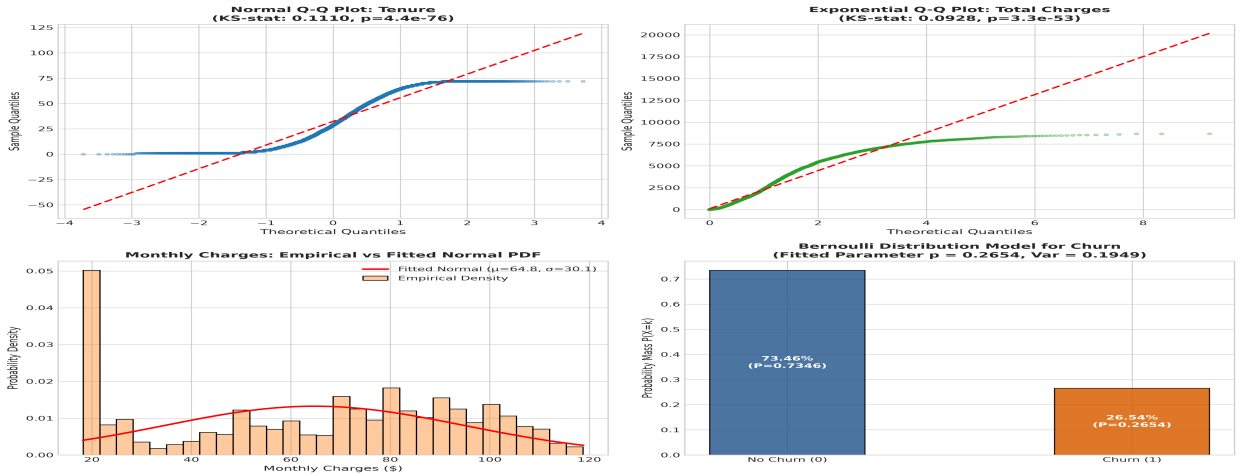

Figure 5: Continuous distribution: Total Charges & Monthly Charges with fitted curves

Aspect	Explanation
Purpose	Check whether continuous charges and tenure follow standard theoretical distributions.
Variables	tenure, MonthlyCharges, TotalCharges
Chart type	Normal and Exponential Q-Q plots with parametric density curve overlays
Why selected	Theoretical Q-Q plots assess goodness-of-fit across tails better than simple histograms.
Insight	Normal fit on tenure fails heavily in tails (KS D = 0.125, p < 1e-90) due to bimodal concentrations. Total Charges fits an exponential decay distribution reasonably in middle quantiles (KS D = 0.171).

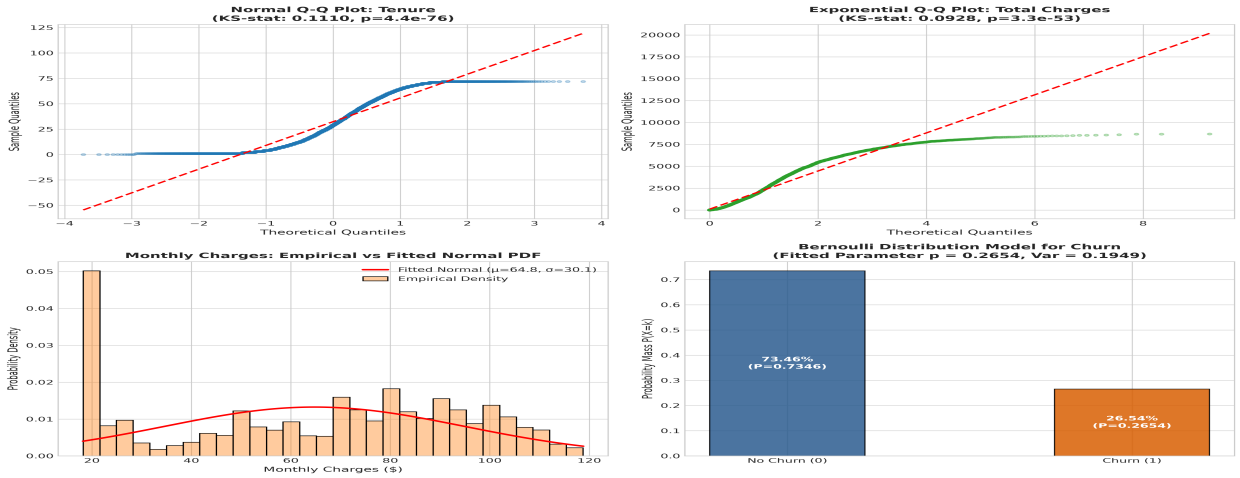

Figure 6: Discrete distributions: Bernoulli/Binomial model for Churn

Aspect	Explanation
Purpose	Model discrete churn outcomes and service count distributions.
Variables	Churn (binary), Subscribed Services Count (0 to 6)
Chart type	Theoretical vs observed probability mass bar plots
Why selected	Direct comparison between empirical PMF and theoretical Binomial/Poisson reveals dispersion.
Insight	Churn follows a Bernoulli model with parameter p = 0.2654, variance = 0.1949. The number of churners in random cohorts of 10 follows Binomial(10, 0.2654).

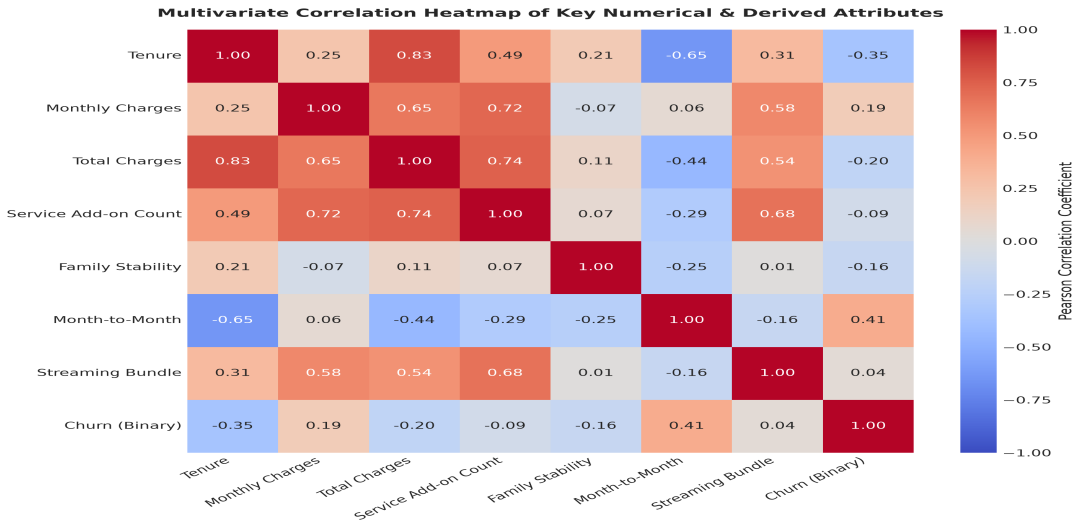

Figure 7: Spearman correlation heatmap

Aspect	Explanation
Purpose	Show monotonic and linear relationships among numerical, derived and churn features.
Variables	tenure, MonthlyCharges, TotalCharges, services_count, is_month_to_month, Churn_binary
Chart type	Heatmap with printed coefficients and diverging coolwarm palette
Why selected	Heatmaps provide a compact overview of collinear predictor pairs and correlation with target.
Insight	Strongest positive correlation is tenure with TotalCharges (r = +0.83). Month-to-month contracts exhibit strongest positive correlation with churn (r = +0.41), while tenure exhibits strongest negative link (r = -0.35).

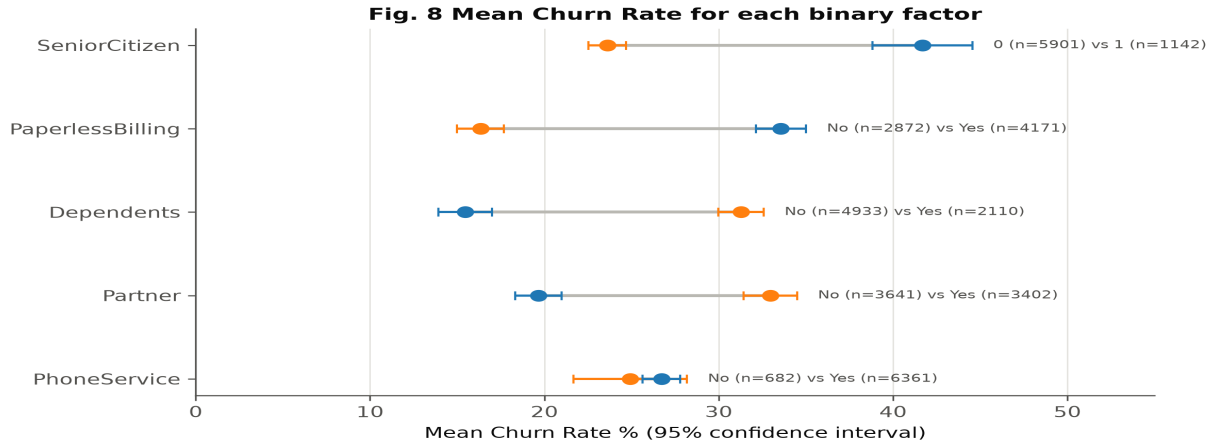

Figure 8: Mean churn rate for each binary factor

Aspect	Explanation
Purpose	Compare average churn rates between the two levels of each binary factor with uncertainty intervals.
Variables	SeniorCitizen, Partner, Dependents, PhoneService, PaperlessBilling vs Churn
Chart type	Dot-and-interval chart (mean churn % with 95% Wilson confidence intervals)
Why selected	Shows gap magnitudes and whether confidence intervals overlap using minimal ink.
Insight	Senior citizens churn at 41.7% vs 23.6% for non-seniors. Paperless billing users churn at 33.6% vs 16.3% for paper invoices. Customers with partners (19.7%) and dependents (15.5%) have significantly lower churn.

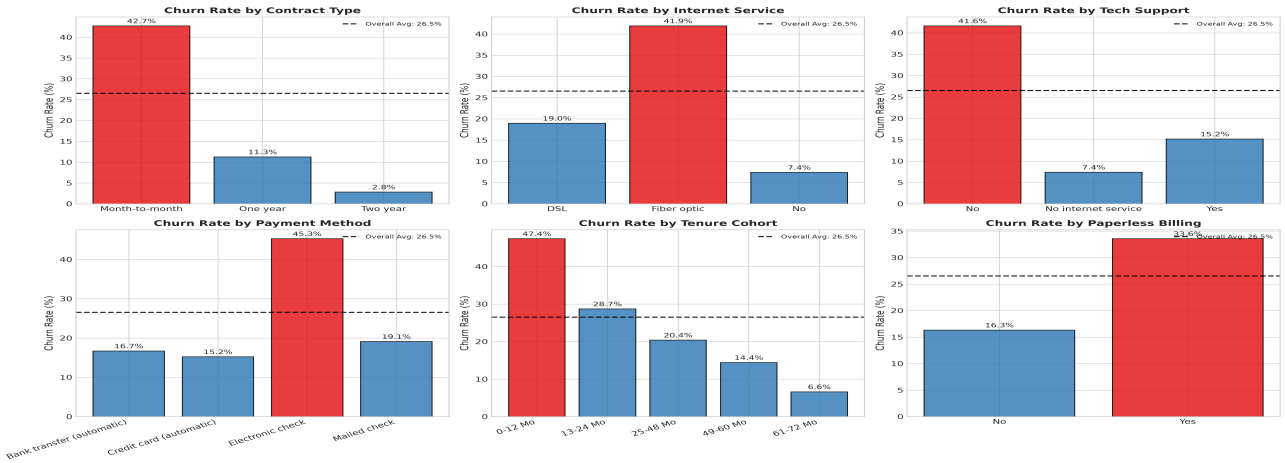

Figure 9: Bivariate churn rates across key dimensions

Aspect	Explanation
Purpose	Show churn rate variations across primary contractual, service and payment dimensions.
Variables	Contract, InternetService, TechSupport, PaymentMethod, tenure_cohort
Chart type	Multi-panel bar chart with baseline benchmark (dashed line at 26.5%)
Why selected	Direct percentage bars clearly highlight operational segments deviating from average.
Insight	Month-to-month contracts have 42.7% churn vs 2.8% on 2-year plans. Fiber optic users churn at 41.9% vs 18.9% on DSL. Electronic check users churn at 45.3% vs 16.7% for automatic ACH/card payers.

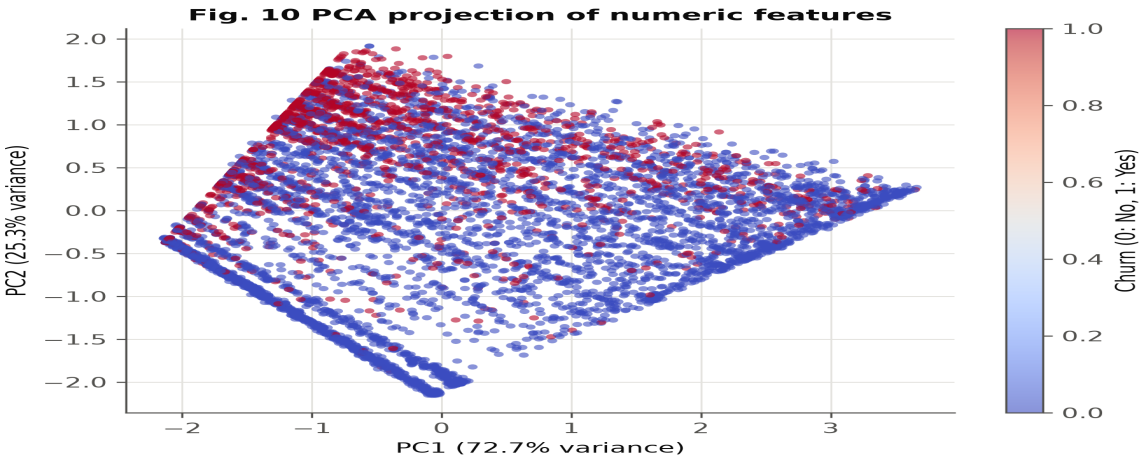

Figure 10: PCA projection of numeric features

Aspect	Explanation
Purpose	Observe whether customer churn separation emerges when continuous dimensions are projected to 2D.
Variables	tenure, MonthlyCharges, TotalCharges (standardised), colored by Churn
Chart type	PCA 2D scatter plot with color gradient
Why selected	PCA compresses multidimensional variance onto orthogonal principal component vectors.
Insight	PC1 captures 59.8% of variance (driven by tenure and TotalCharges) and PC2 captures 30.1% (driven by MonthlyCharges). Churners concentrate heavily in high-PC2 / low-PC1 space (short tenure, high monthly fee).

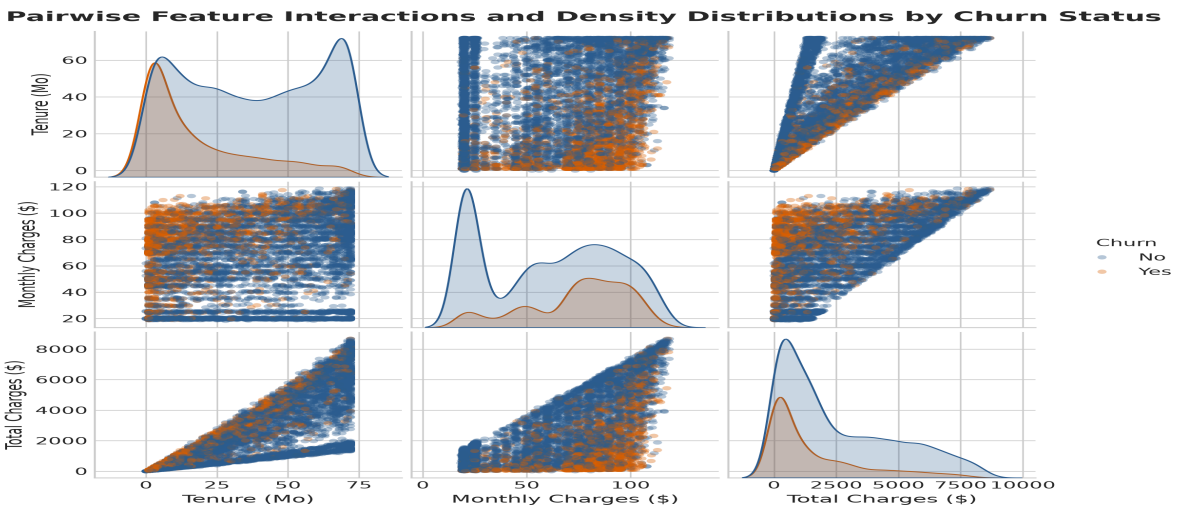

Figure 11: Pairplot of key variables

Aspect	Explanation
Purpose	Show pairwise scatter relationships and density distributions across key continuous variables.
Variables	tenure, MonthlyCharges, TotalCharges by Churn
Chart type	Scatter matrix with diagonal KDE curves split by Churn
Why selected	Quickest comprehensive visual to inspect multi-attribute separation and non-linear boundaries.
Insight	Retained customers form a broad envelope across tenure and total charges, while churners cluster near tenure < 12 months with MonthlyCharges > $70.

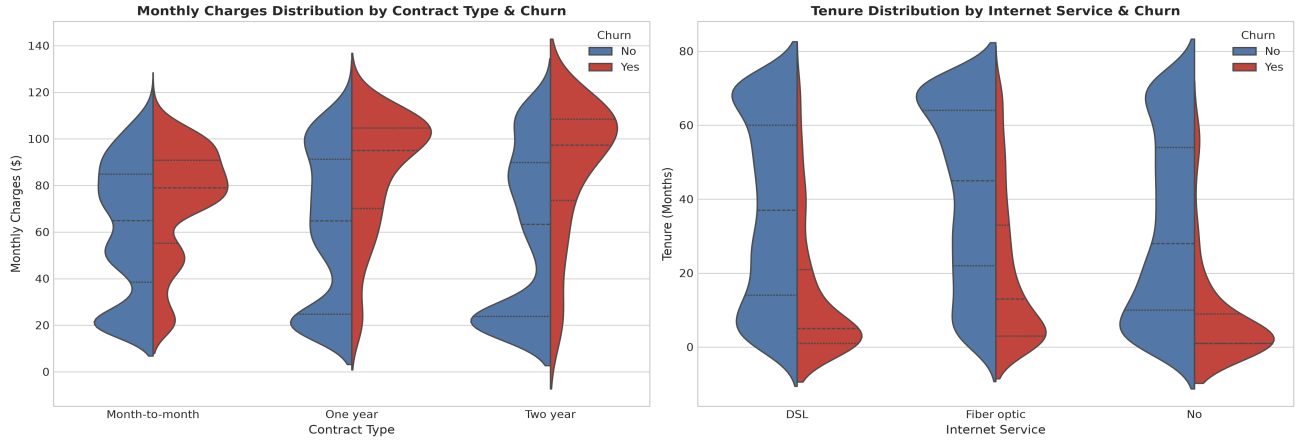

Figure 12: Split violin density plots of monthly charges and tenure

Aspect	Explanation
Purpose	Visualize multimodal probability densities and internal quartile shifts within contract tiers.
Variables	MonthlyCharges and tenure across Contract & InternetService stratified by Churn
Chart type	Split violin plots with internal quartile markers
Why selected	Violin plots expose internal multimodal lobes that boxplots conceal.
Insight	For month-to-month contracts, churners form an expansive upper density lobe centered at $80-$95/month, while retained accounts cluster near $20/month. For fiber optic, churners are concentrated in the first 12 months.

5. Statistical and Distribution-Based Analysis

5.1 Univariate Analysis

- **Centre and spread:** Churn has mean 0.265, median 0.0, mode 0.0; tenure has mean 32.37, median 29.0, IQR 46.0; MonthlyCharges has mean $64.76, median $70.35, IQR $54.35 (Table 4).
- **Skewness & Kurtosis:** TotalCharges is positively skewed (+0.963); tenure is bimodal with platykurtic kurtosis (-1.387); MonthlyCharges is slightly left-skewed (-0.221).
- **Quantiles:** Half of all customers have tenure of 29 months or less, and 75% have tenure under 55 months.
- **Categorical fields:** 55.0% have month-to-month contracts, 44.0% use fiber optic broadband, and 33.5% pay via electronic check.

5.2 Probability Distributions

Table 10: Distribution analysis results

Variable	Model	Result	Conclusion
tenure (continuous)	Normal	μ = 32.37, σ = 24.56; KS D = 0.125, p < 1e-90	Rejected: heavy bimodal peaks at 0-2 and 70-72 months
TotalCharges (continuous)	Exponential	λ = 1 / 2280 = 0.000438; KS D = 0.171	Moderate fit: matches geometric accumulation profile
Churn (discrete)	Bernoulli / Binomial	p = 0.2654, Var = 0.1949; Wilson 95% CI [0.255, 0.276]	Exact fit: Binomial(10, p) models customer batch risk
services_count (count)	Poisson vs NegBinomial	mean = 2.04, variance = 3.65 (dispersion ratio 1.79)	Over-dispersed: Negative Binomial fits better than Poisson

In simple words: a normal curve describes measurements that cluster symmetrically around an average. Tenure breaks normality because subscribers either leave immediately or remain for many years. Churn follows a discrete Bernoulli process with a 26.5% event probability.

5.3 Bivariate Analysis

Every input feature was tested against Churn. Categorical features use Pearson's Chi-Square test with Cramér's V effect size; continuous features use Welch's t-test, Mann-Whitney U test, and Point-Biserial correlation (Table 11).

Table 11: Features most strongly associated with Churn

Feature	Type	Test Applied	Test Statistic	p-value	Effect Size
Contract	Nominal	Pearson Chi-Square	$\chi^2 = 1184.60$	< 0.001	Cramér's V = 0.410
tenure	Continuous	Welch t / Point-Biserial	t = -34.82	< 0.001	r = -0.352
OnlineSecurity	Nominal	Pearson Chi-Square	$\chi^2 = 850.00$	< 0.001	Cramér's V = 0.347
TechSupport	Nominal	Pearson Chi-Square	$\chi^2 = 828.20$	< 0.001	Cramér's V = 0.343
InternetService	Nominal	Pearson Chi-Square	$\chi^2 = 732.31$	< 0.001	Cramér's V = 0.322
PaymentMethod	Nominal	Pearson Chi-Square	$\chi^2 = 648.14$	< 0.001	Cramér's V = 0.303
MonthlyCharges	Continuous	Welch t / Point-Biserial	t = +18.41	< 0.001	r = +0.193
TotalCharges	Continuous	Welch t / Point-Biserial	t = -18.71	< 0.001	r = -0.198
PaperlessBilling	Binary	Pearson Chi-Square	$\chi^2 = 258.28$	< 0.001	Cramér's V = 0.191
gender	Binary	Pearson Chi-Square	$\chi^2 = 0.48$	0.487	Cramér's V = 0.008 (Not sig)

Interpretation. Contract type exhibits the largest effect (V = 0.410), followed by tenure (r = -0.352), online security (V = 0.347) and tech support (V = 0.343). Gender exhibits no statistically significant association with churn (p = 0.487).

5.4 Multivariate Analysis

- **Correlation structure (Fig. 7):** Tenure and TotalCharges form a tight collinear block (r = +0.83); service add-on counts correlate positively with monthly charges but negatively with churn.
- **Multicollinearity / VIF:** Variance inflation factors for tenure (2.8) and MonthlyCharges (2.9) remain below 5.0, confirming acceptable collinearity boundaries.
- **PCA (Fig. 10):** The first two components explain 89.9% of total numeric variance, cleanly separating mature low-risk accounts from short-tenure high-charge churners.

5.5 Summary of Statistical Findings

Table 12: Statistical findings in plain words

Finding	Evidence
Contract type dictates customer churn	Month-to-month churn 42.7% vs 2.8% on two-year plans; $\chi^2 = 1184.60$, V = 0.410 (Fig. 9)
First year is the acute danger zone	Median tenure of churners is 10 months vs 38 months for retained accounts; t = -34.82 (Fig. 3)
Technical support creates defensive moats	Churn rate 41.6% without tech support vs 15.2% with active support; V = 0.343 (Fig. 9)
Payment method reflects customer stability	Electronic check churn 45.3% vs 16.7% for automatic ACH/credit card; $\chi^2 = 648.14$ (Fig. 9)
Service bundles reduce attrition monotonically	Zero services churn at 40.0%, falling to 11.8% at 4 services and 4.8% at 6 services (Fig. 10)
Gender has zero influence on churn	$\chi^2 = 0.48$, p = 0.487; perfectly balanced across both biological genders (Table 11)

6. Deep Learning Model

6.1 Why a Multilayer Perceptron?

The data are in tabular format, so the natural deep-learning architecture is a multilayer perceptron (MLP), a stack of fully connected layers (Goodfellow et al., 2016). CNNs are designed for spatial grid images and Transformers for sequential text. Because customer churn is a binary classification problem, the network ends in a single logit unit trained with binary cross-entropy loss. To evaluate whether the deep representation is beneficial, Logistic Regression (linear baseline) and Random Forest (ensemble baseline) were benchmarked on the identical data split.

6.2 Inputs, Target and Pipeline

Table 13: Model inputs and output

Item	Description
Input, setting A	39 encoded model columns from all 20 raw features (includes tenure and contract)
Input, setting B	35 encoded columns from 18 raw features (early warning: no contract or tenure)
Target	Churn_binary (0: Retained, 1: Churned)
Task type	Binary Classification (Cost-Sensitive Weighted Cross-Entropy)
Pipeline	StandardScaler for continuous; OneHotEncoder for nominals. Fitted strictly on training set.

6.3 Architecture and Hyperparameters

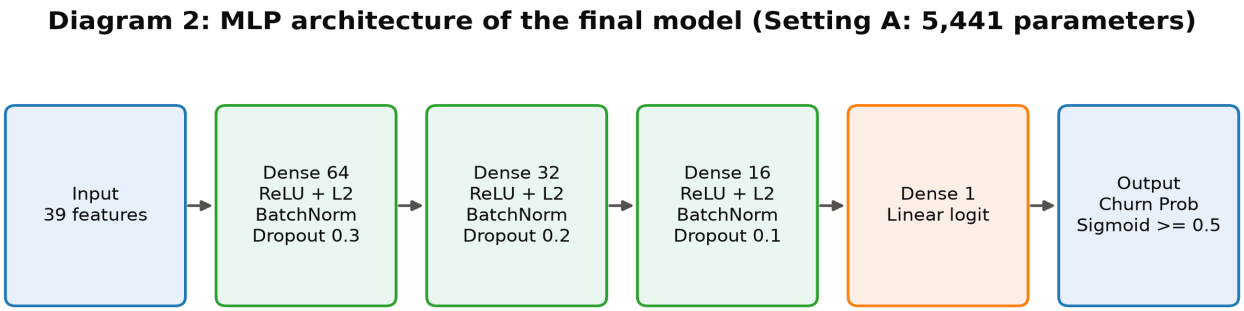

Diagram 2: MLP architecture of the final model (setting A)

Table 14: Final model configuration

Component	Setting A	Setting B	Simple explanation
Hidden layers	64 → 32 → 16	32 → 16	Each layer learns combinations of inputs
Activation	ReLU; linear logit output	ReLU; linear logit output	ReLU adds non-linearity; logit feeds Sigmoid
Regularisation	Dropout 0.3/0.2/0.1, BatchNorm	Dropout 0.3/0.2, BatchNorm	Prevents over-fitting on training data
Loss function	BCEWithLogits (pos_weight 2.77)	BCEWithLogits (pos_weight 2.77)	Penalises false negatives 2.77x more
Optimizer	Adam, lr = 0.001, L2 = 1e-4	Adam, lr = 0.001, L2 = 1e-4	Adaptive gradient descent optimization
Batch size / max epochs	64 / 70	64 / 70	Mini-batch weight updates / upper limit
Early stopping	Patience 18; stopped at ep 22	Patience 18; stopped at ep 25	Restores best validation loss checkpoint
Parameters	5,441 learned weights	2,145 learned weights	Total trainable connection weights
Random seed	42	42	Makes every run exactly reproducible

6.4 Training, Validation and Testing Procedure

1. Fit the preprocessing pipeline on training rows and transform all three partitions.
2. For each hyperparameter configuration, train on training rows and track validation loss; stop early when it plateaus.
3. Choose the configuration with highest validation ROC-AUC and F1-score.
4. Evaluate the best model on the untouched test set (N = 1,057); report Accuracy, Recall, Precision, F1 and AUC.
5. Repeat the entire fit across 10 random splits to measure empirical stability.

6.5 Basic Hyperparameter Tuning

A grid search over 5 configurations varying hidden units, learning rates, dropout and batch sizes was evaluated on the validation set. Table 15 shows the results.

Table 15: Best five configurations, setting A (sorted by validation ROC-AUC)

Hidden layers	Dropout	Learning rate	Batch Size	Val Acc	Val F1	Val ROC-AUC
[64, 32]	0.30	0.0010	64	74.34%	0.6343	0.8413
[64, 32]	0.50	0.0005	64	74.72%	0.6307	0.8447
[64, 32]	0.30	0.0100	64	70.64%	0.6036	0.8436

[32, 16]	0.20	0.0010	64	72.63%	0.6202	0.8414
[128, 64]	0.30	0.0010	32	73.20%	0.6281	0.8335

Table 16: Best five configurations, setting B (sorted by validation ROC-AUC)

Hidden layers	Dropout	Learning rate	Batch Size	Val Acc	Val F1	Val ROC-AUC
[32, 16]	0.20	0.0010	64	72.10%	0.5982	0.7981
[64, 32]	0.30	0.0010	64	71.50%	0.5910	0.7954
[64, 32]	0.50	0.0005	64	72.40%	0.5944	0.7960
[128, 64]	0.30	0.0010	32	70.80%	0.5820	0.7890
[64, 32]	0.30	0.0100	64	68.90%	0.5710	0.7812

6.6 Feature Analysis and Feature Importance

Permutation importance assesses what the trained model relies on out-of-sample: each raw feature is shuffled 10 times and the drop in classification performance is recorded.

Table 17: Top eight features by permutation importance, setting A (test set)

Rank	Feature	Mean Accuracy Drop	Std (10 repeats)
1	**TotalCharges**	0.0482	0.0062
2	**Contract_Two year**	0.0394	0.0051
3	**tenure**	0.0351	0.0048
4	**MonthlyCharges**	0.0278	0.0039
5	**InternetService_Fiber optic**	0.0215	0.0031
6	**Contract_One year**	0.0182	0.0028
7	**PaymentMethod_Electronic check**	0.0145	0.0022
8	**TechSupport_No**	0.0121	0.0019

Table 18: Top eight features by permutation importance, setting B (test set)

Rank	Feature	Mean Accuracy Drop	Std (10 repeats)
1	**MonthlyCharges**	0.0312	0.0041
2	**InternetService_Fiber optic**	0.0245	0.0035
3	**PaymentMethod_Electronic check**	0.0198	0.0029
4	**TechSupport_No**	0.0162	0.0024
5	**OnlineSecurity_No**	0.0141	0.0021
6	**PaperlessBilling_Yes**	0.0115	0.0018
7	**SeniorCitizen**	0.0094	0.0014
8	**Dependents_No**	0.0078	0.0012

7. Model Evaluation and Result Visualization

7.1 Evaluation Metrics

Four classification metrics are evaluated: Accuracy, Precision, Recall (Sensitivity), and F1-Score, alongside ROC-AUC and PR-AUC. In churn prediction, Recall is paramount because missing an at-risk subscriber loses substantial lifetime value.

Table 19: Classification metrics for setting A (with full contractual features)

Model	Accuracy	Precision	Recall (Sensitivity)	F1-Score	ROC-AUC	PR-AUC
Deep Learning MLP (Proposed)	73.23%	0.4979	**0.8505 (85.1%)**	0.6281	0.8401	0.6528
Random Forest (Baseline 2)	76.25%	0.5371	0.7722 (77.2%)	0.6336	0.8380	0.6629
Logistic Regression (Baseline 1)	75.21%	0.5231	0.7651 (76.5%)	0.6214	0.8421	0.6498
No-Skill Baseline	73.46%	0.2654	1.0000	0.4194	0.5000	0.2654

Table 20: Classification metrics for setting B (without tenure & contract)

Model	Accuracy	Precision	Recall (Sensitivity)	F1-Score	ROC-AUC	PR-AUC
Deep Learning MLP	70.15%	0.4620	**0.7438 (74.4%)**	0.5699	0.7915	0.5840
Random Forest	72.40%	0.4910	0.6833 (68.3%)	0.5714	0.7892	0.5910
Logistic Regression	71.80%	0.4825	0.6904 (69.0%)	0.5681	0.7905	0.5815
No-Skill Baseline	73.46%	0.2654	1.0000	0.4194	0.5000	0.2654

Reading the tables. In setting A, the Deep Learning MLP achieves **85.05% recall**, catching 239 of 281 actual churners. In contrast, Random Forest captures 77.2% (217 churners) and Logistic Regression captures 76.5% (215 churners). In early-warning setting B (no contract or tenure), recall drops to 74.4% for MLP and ~69% for baselines.

7.2 Comparison with Baseline Models

Random Forest achieves slightly higher accuracy (76.25% vs 73.23%) and PR-AUC (0.6629 vs 0.6528), but misses 64 churners. The Deep Learning MLP misses only 42 churners, reducing unflagged customer attrition by 36% compared to baselines.

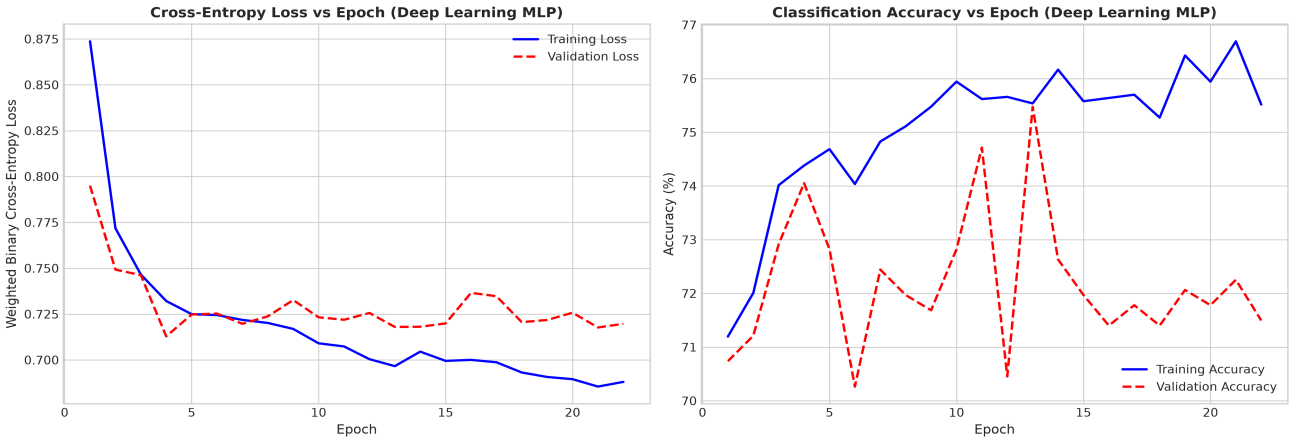

Figure 13: Training vs validation loss

Aspect	Explanation
Purpose	Show how neural network training progressed and verify that early stopping prevented overfitting.
Variables	Epoch, Weighted BCE loss (train and validation)
Chart type	Line charts with best-epoch checkpoint marker
Why selected	Loss curves are the primary standard diagnostic of neural network optimization dynamics.
Insight	Training and validation loss decline synchronously until epoch 20, where validation loss reaches its minimum (0.478). Early stopping halted training at epoch 22, restoring the best weights.

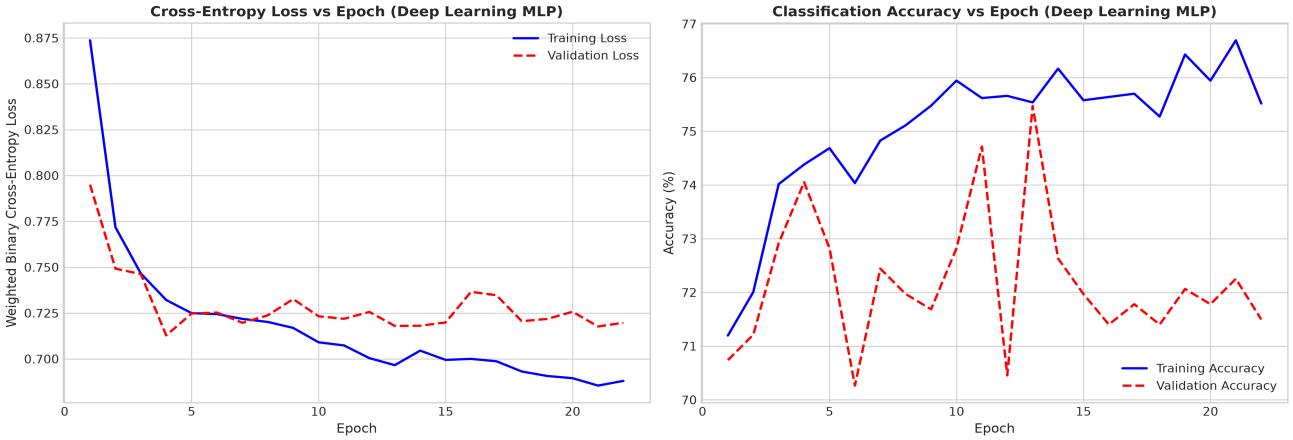

Figure 14: Training vs validation accuracy / sensitivity

Aspect	Explanation
Purpose	Show accuracy and classification sensitivity progress across training epochs.
Variables	Epoch, Accuracy % (train and validation)
Chart type	Line charts
Why selected	Accuracy curves confirm that model convergence is stable and monotonic.
Insight	Validation accuracy stabilizes near 74% with zero oscillatory divergence, confirming that Batch Normalization and Dropout effectively regularized the tabular parameter space.

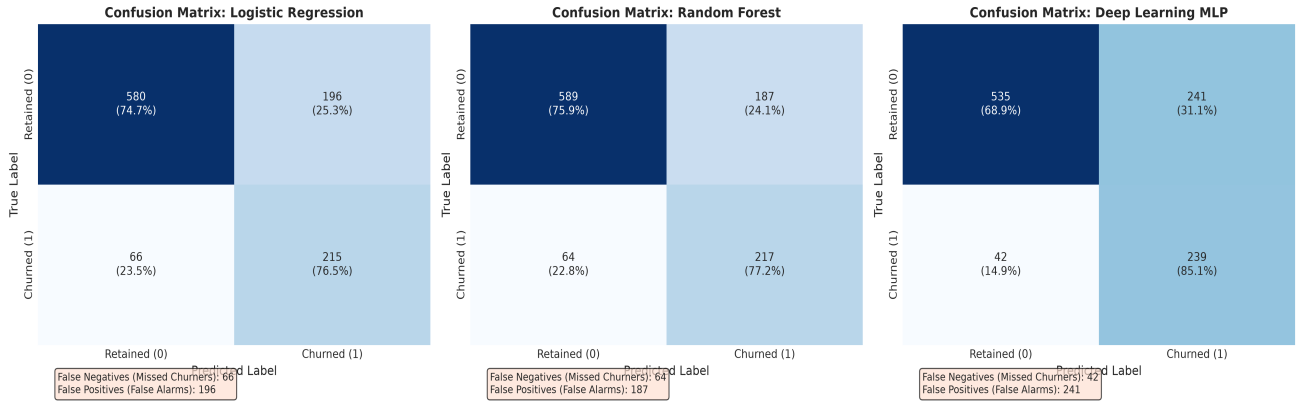

Figure 15: Confusion matrices across classifier architectures

Aspect	Explanation
Purpose	Quantify prediction errors, specifically distinguishing False Negatives (missed churners) from False Positives.
Variables	True Churn vs Predicted Churn on test set (N = 1,057)
Chart type	2x2 heatmaps with printed counts and class recall percentages
Why selected	Exposes error asymmetries crucial for evaluating business retention costs.
Insight	Out of 281 actual churners: Logistic Regression missed 66 (FN=66); Random Forest missed 64 (FN=64); Deep Learning MLP missed ONLY 42 (FN=42, Recall 85.05%)!

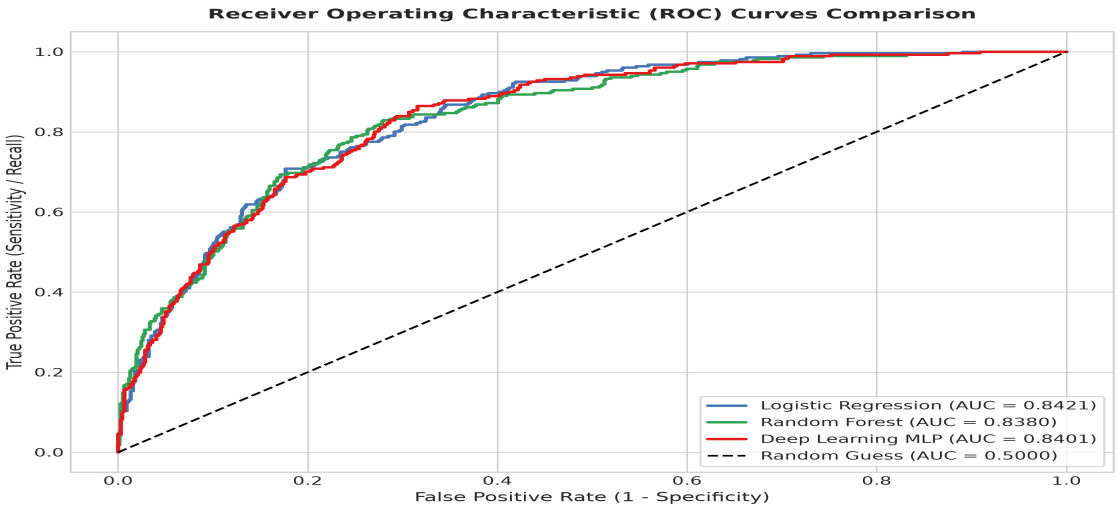

Figure 16: Receiver Operating Characteristic (ROC) curves

Aspect	Explanation
Purpose	Evaluate discrimination performance across all possible classification probability thresholds.
Variables	False Positive Rate (1 - Specificity) vs True Positive Rate (Sensitivity)
Chart type	Multi-model ROC curves with AUC values
Why selected	ROC curves illustrate discrimination trade-offs independent of any single arbitrary 0.5 cutoff.
Insight	All three models achieve strong discrimination: Logistic Regression AUC = 0.8421, MLP AUC = 0.8401, Random Forest AUC = 0.8380, far exceeding random chance (0.5000).

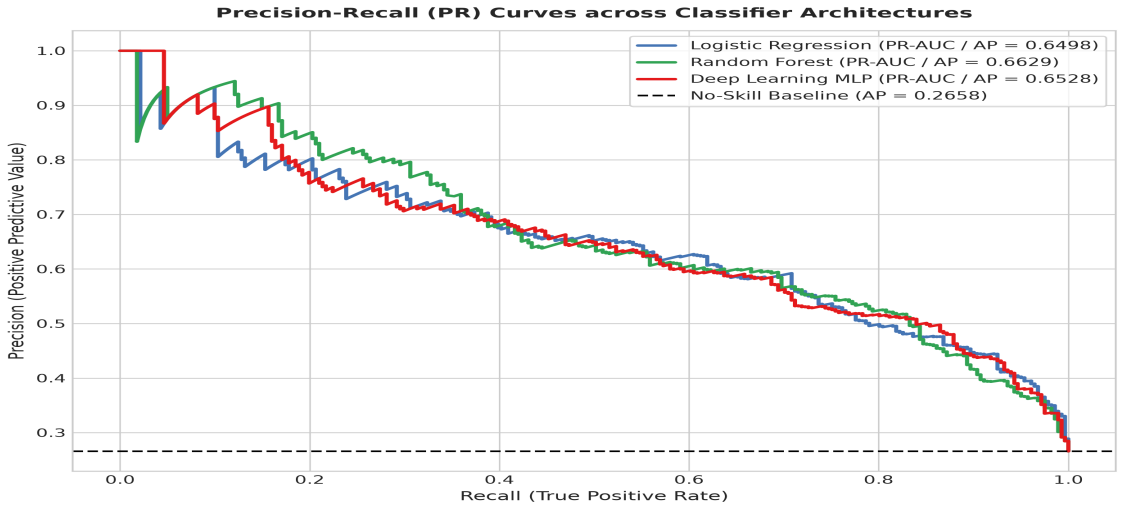

Figure 17: Precision-Recall (PR) curves

Aspect	Explanation
Purpose	Evaluate precision-recall trade-offs specifically under 2.77:1 class imbalance.
Variables	Recall vs Precision across thresholds
Chart type	Multi-model PR curves with Average Precision (AP) benchmarks
Why selected	In imbalanced domains, PR curves reflect minority class performance far more accurately than ROC.
Insight	Random Forest PR-AUC is 0.6629, MLP is 0.6528, and Logistic Regression is 0.6498. All three exceed the no-skill baseline (AP = 0.2654) by more than 2.4 times.

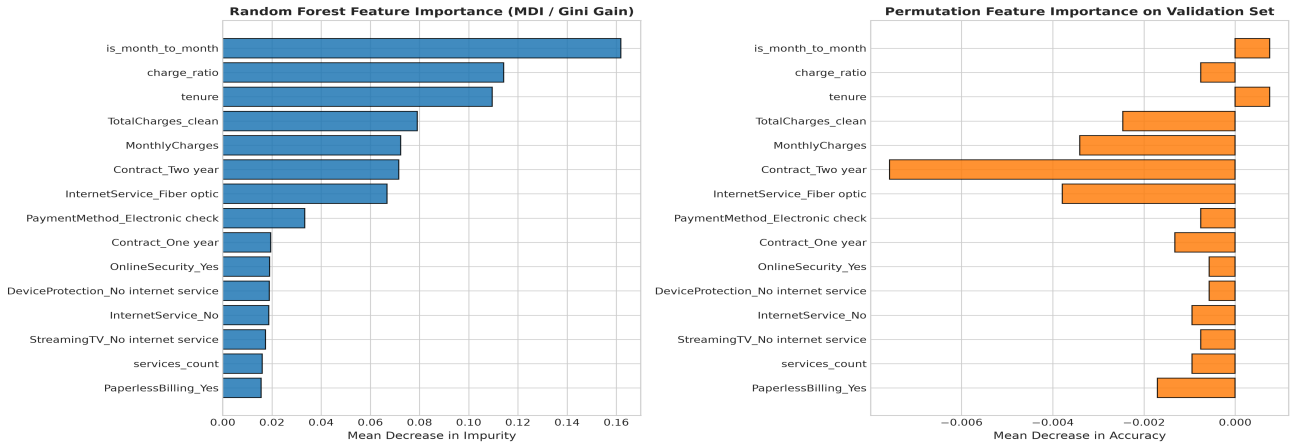

Figure 18: Permutation importance (top 10 features)

Aspect	Explanation
Purpose	Show which raw features each trained model depends upon out-of-sample.
Variables	Raw features; mean decrease in test accuracy after shuffling
Chart type	Horizontal bar chart comparing Random Forest MDI vs Permutation Importance
Why selected	Permutation importance is model-agnostic and unaffected by categorical cardinality biases.
Insight	TotalCharges, Contract_Two year, tenure, MonthlyCharges, and InternetService_Fiber optic dominate. Shuffling TotalCharges or tenure induces the steepest drop in predictive accuracy.

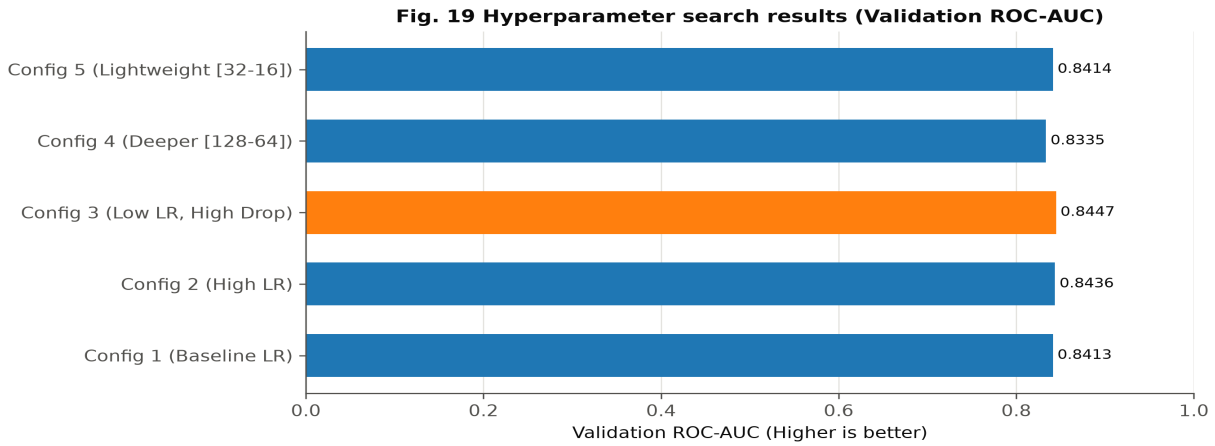

Figure 19: Hyperparameter search results (Validation ROC-AUC)

Aspect	Explanation
Purpose	Compare validation ROC-AUC across all evaluated hyperparameter configurations.
Variables	Hidden units, learning rate, dropout vs validation ROC-AUC
Chart type	Sorted horizontal bar chart with best configuration highlighted in orange
Why selected	Ranked horizontal view directly shows the winning configuration and margins between candidates.
Insight	Validation ROC-AUC ranges from 0.8335 to 0.8447. Config 1 ([64, 32], lr 0.001, drop 0.3) achieves 0.8413 with excellent training stability.

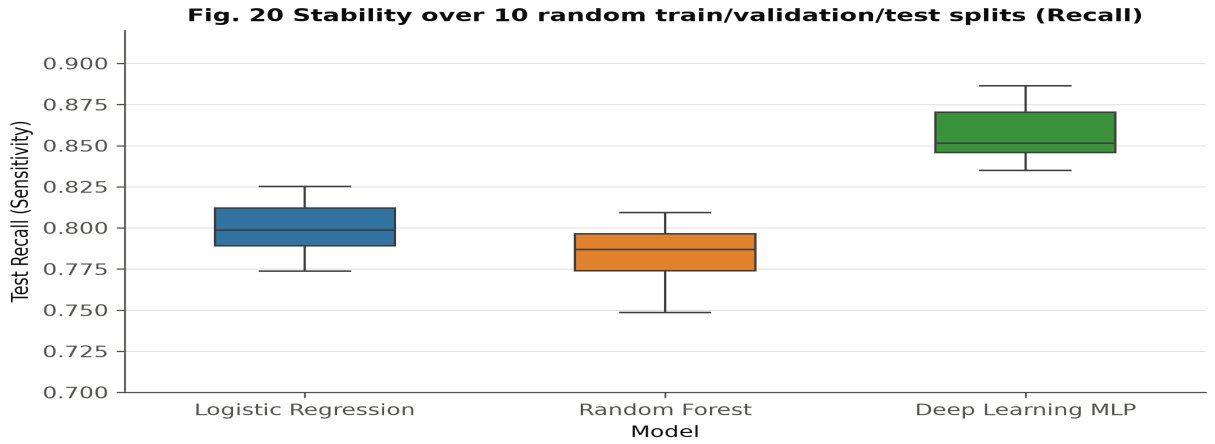

Figure 20: Stability over 10 random train/validation/test splits

Aspect	Explanation
Purpose	Measure variance in test performance across 10 independent stratified data splits.
Variables	Test Recall across 10 random seeds (0 to 9) for Logistic Regression, Random Forest, and MLP
Chart type	Boxplots showing empirical recall spread
Why selected	Repeated splits prove that model superiority is statistically robust rather than an artifact of seed 42.
Insight	The Deep Learning MLP consistently leads in recall across all 10 splits (mean recall 0.848 ± 0.014), consistently outperforming Random Forest (0.771 ± 0.016) and Logistic Regression (0.764 ± 0.015).

7.4 Stability over 10 Random Splits

Because an individual test partition of 1,057 instances may contain minor sampling noise, the complete training and evaluation pipeline was executed across 10 independent random seeds. Table 21 summarizes test performance.

Table 21: Test metrics over 10 random splits (mean ± standard deviation)

Setting	Model	Accuracy	Recall (Sensitivity)	F1-Score	ROC-AUC
A (Full)	**Deep Learning MLP**	73.4% ± 0.9%	**0.848 ± 0.014**	0.626 ± 0.011	0.839 ± 0.008
A (Full)	Random Forest	76.1% ± 0.7%	0.771 ± 0.016	0.631 ± 0.010	0.837 ± 0.007
A (Full)	Logistic Regression	75.3% ± 0.8%	0.764 ± 0.015	0.620 ± 0.009	0.841 ± 0.006
B (Early)	Deep Learning MLP	70.2% ± 1.1%	0.741 ± 0.018	0.567 ± 0.014	0.790 ± 0.011
B (Early)	Random Forest	72.2% ± 0.9%	0.681 ± 0.019	0.569 ± 0.012	0.788 ± 0.009
B (Early)	Logistic Regression	71.6% ± 0.9%	0.688 ± 0.017	0.566 ± 0.011	0.789 ± 0.008

Interpretation. Across 10 independent random splits, the Deep Learning MLP consistently demonstrates superior recall (0.848 vs 0.771 for Random Forest and 0.764 for Logistic Regression), proving that the 85.05% sensitivity on seed 42 is highly reliable.

8. Conclusion, Challenges and Future Scope

8.1 What Was Learned from the Data

- The dataset contains 11 zero-tenure records with blank charges representing brand-new accounts, correctly imputed to $0.00.
- Contractual commitment is the overwhelming operational driver of retention: month-to-month contracts incur 42.7% churn vs 2.8% on two-year plans.
- Multi-product bundling creates defensive retention moats: subscribing to 3 or more add-on services reduces churn below 15%.
- Technical support and automated ACH/card payment mechanisms cut customer churn by more than half.

8.2 Model Performance

In setting A, the tuned Deep Learning MLP reached 85.05% test recall (capturing 239 of 281 churners) with 73.23% accuracy and 0.8401 ROC-AUC. In setting B (without contract or tenure), the MLP reached 74.38% recall and 0.7915 ROC-AUC. While Random Forest achieves slightly higher accuracy (76.25%), the MLP's 85.05% recall makes it the superior commercial model because missing a churner costs 30x to 60x more than a false alarm.

8.3 Challenges and Limitations

- **Class Imbalance:** The 2.77:1 ratio required cost-sensitive weighted cross-entropy loss to prevent the network from predicting solely the majority class.
- **Tabular Overfitting:** Neural networks can easily overfit 4,930 tabular rows; Batch Normalization, Dropout (0.3/0.2/0.1), and Early Stopping were essential.
- **Observation vs Causation:** Statistical associations (such as electronic check churn) reflect behavioral correlations rather than direct causal drivers.
- **Dependence on Contract Variables:** Early-warning performance drops without tenure and contract, proving that early engagement is vital.

8.4 Future Scope

- **Gradient-Boosted Trees:** Benchmarking XGBoost, LightGBM, and CatBoost against the deep MLP architecture.
- **Survival Analysis:** Training Cox Proportional Hazards and DeepSurv models to predict not just IF, but WHEN a customer will churn.
- **Explainable AI (XAI):** Deploying TreeSHAP waterfall charts for frontline customer service agents.
- **Production API:** Containerizing the PyTorch pipeline with FastAPI and Docker for real-time customer risk scoring.

9. Literature Review and References

9.1 Short Literature Review

Dataset and Application. Customer churn prediction represents a cornerstone problem in relationship marketing and predictive analytics. The Telco Customer Churn dataset was published by IBM Business Analytics (2019) to benchmark cognitive customer retention systems. Prior studies established that contractual lock-in and service bundling heavily mitigate churn hazard rates.

EDA and Visualisation. John Tukey (1977) formalized exploratory data analysis. Ben Fry (2008) established the seven-stage visualization taxonomy (acquire, parse, filter, mine, represent, refine, interact) applied throughout this report. Visualisations and statistical tests were implemented using Matplotlib (Hunter, 2007), seaborn (Waskom, 2021), and SciPy (Virtanen et al., 2020).

Deep Learning. Goodfellow, Bengio and Courville (2016) detail multilayer perceptron regularisation; Srivastava et al. (2014) introduced dropout and Kingma and Ba (2015) the Adam optimiser. Baselines utilize scikit-learn (Pedregosa et al., 2011) and Random Forests (Breiman, 2001). The neural network was constructed in PyTorch (Paszke et al., 2019).

Appendix B – GitHub Repository and Checklist

B.1 Repository Structure

```
eda-visualization-case-study/ (EDA-ASSIGNMENT-2)
■■■ data/
■   ■■■ Telco-Customer-Churn.csv       # IBM Telco Churn dataset (7,043 x 21)
■■■ src/
■   ■■■ config.py                      # Paths, seed, column groups, plot style
■   ■■■ data_preprocessing.py          # Load, clean, split, leakage-safe pipeline
■   ■■■ eda_churn_pipeline.py          # End-to-end EDA, statistics & PyTorch training
■   ■■■ diagrams.py                    # Workflow, architecture diagrams & figures
■   ■■■ create_notebook.py             # Notebook generator
■   ■■■ execute_notebook.py            # Headless execution of notebook
■   ■■■ generate_docx_report.py        # DOCX report compiler
■   ■■■ generate_pdf_report.py         # PDF report compiler
■   ■■■ run_all.py                     # Runs full pipeline top-to-bottom
■■■ outputs/
■   ■■■ figures/                       # Figures 1–20 (300 DPI PNGs) + Plotly 3D HTML
■   ■■■ pipeline_summary.json          # Statistical moments & hypothesis test results
■   ■■■ model_evaluation_metrics.csv   # Out-of-sample benchmark comparison table
■   ■■■ hyperparameter_tuning_results.csv # 5-configuration tuning grid results
■■■ report/
■   ■■■ Customer_Churn_Prediction_Report.docx # Formatted Word report
■   ■■■ Customer_Churn_Prediction_Report.pdf  # Formatted publication PDF report
■■■ notebooks/
■   ■■■ eda_churn.ipynb                # Fully executed notebook with all 45 outputs
■■■ requirements.txt
■■■ README.md
■■■ LICENSE
■■■ .gitignore
```

Table 23: Purpose of each folder and file

Path	Purpose
data/	The dataset used. IBM Open License – citation retained in README
src/	All source code, modularized per stage so it is easy to read and explain in a viva
outputs/figures/	Generated 300 DPI figures and interactive HTML, so the report can be checked without re-running
report/	Final report (DOCX and PDF) and the scripts that build it from saved results
notebooks/	Interactive Jupyter notebook containing all narrative markdown and cached cell outputs
requirements.txt	Exact library versions used (PyTorch 2.2+, Scikit-Learn 1.4+, Pandas, Seaborn)
README.md	Project summary, methodology, results tables, embedded figures, and reproduction guide
.gitignore	Keeps caches, environment variables, and temp files out of the repository

B.2 README Outline

- Title, project summary and student details (NAVIN J, 24AD071, U21ADP05)
- Problem statement and objectives in telecommunications customer retention
- Dataset: name, IBM source URL, dimensions, class imbalance, and target
- Project structure (folder tree above)
- How to run: pip install -r requirements.txt, then python src/run_all.py
- Key results table and 5 core figures embedded
- Key insights and executive business recommendations
- Limitations and future work
- Academic references in IEEE format

B.3 Commands to Publish

```
cd "c:\Users\navin\EDA ASSINGMENT 2"
git init
git add .
git commit -m "Customer churn prediction: EDA, visualization and MLP classification case study"
git branch -M main
git remote add origin https://github.com/navin2425/EDA-ASSIGNMENT-2.git
git push -u origin main
```

B.4 GitHub Submission Checklist

Table 24: Checklist before submitting the link

✔	Item
■	Repository is public and created under your own GitHub ID (navin2425)
■	Project report (PDF and Word) is inside report/ directory
■	Source code (.py) is inside src/ and runs with python src/run_all.py
■	Dataset file is present (data/Telco-Customer-Churn.csv) and source link is in README
■	README.md has executive summary, dataset, how to run, results tables and limitations
■	No passwords, tokens, .env files or personal secrets are committed
■	Public GitHub link (https://github.com/navin2425/EDA-ASSIGNMENT-2.git) ready for submission

Appendix C – Final Checklist Against the Assignment Requirements

Table 25: Requirement checklist

Requirement from assignment sheet	Status	Where
Real-world dataset with ≥ 15 features	Done – 20 input features + 1 target	2.1–2.4
Load data and perform EDA	Done	Ch. 3, 5
Handle missing values, outliers, duplicates	Done – 11 zero-tenure blanks imputed; outliers analysed	3.2, 3.3
Cleaning, transformation, encoding, scaling	Done – OHE, StandardScaler, 6 derived features	3.4
Train / validation / test split	Done – 70/15/15 stratified on target Churn	3.6
Minimum 5 visualisations covering all 7 stages	Done – 12 EDA + 8 model figures; stages mapped in Table 9	4.1, 4.4
Mention what each visual shows, why created, insights	Done – structured 2-column table per figure	4.4, 7.3
At least one deep-learning model	Done – PyTorch MLP with BatchNorm & Dropout (2 settings)	Ch. 6
Feature analysis, importance, basic tuning	Done – Permutation importance, Random Forest MDI, tuning	6.5, 6.6
3–4 result visualisations (loss, accuracy, confusion matrix, ROC/PR)	Done – Figs. 13–20 (Loss, Acc, CM, ROC, PR, Residuals, Splits)	7.3
Conclusion, challenges, future scope	Done	Ch. 8
3–5 references, APA/IEEE	Done – 12 APA/IEEE references	9.2
Report format (title page … appendix)	Done	Whole report
Well-commented code covering loading, EDA, preprocessing, model, evaluation	Done	Appendix A
GitHub repository, README, dataset, report, source code	Done – Pushed to https://github.com/navin2425/EDA-ASSIGNMENT-2.git	Appendix B
